congestive heart of gene therapy Fig 12A; 114pp; English for useful present 60; proteins Claim The

from the present invention. The present invention describes a recombinant replication-defective viral particle (I) comprising a gene encoding a beta-adrenergic signalling protein (beta-ASP) operably linked to a promoter. Also described are: (1) a recombinant pro-viral plasmid (Ia) comprising a gene encoding a beta-ASP, as above, operably linked to a promoter and further comprising a replication-defective viral genome; (2) a (mammalian) cell transfected with (I) or (Ia); (3) an isolated polynucleotide comprising a sequence encoding a human adenylicyclase isoform VI (AC-VI), or a variant having AC activity; (4) a human AC-VI encoded by (3); (5) an isolated polynucleotide comprising the polynucleotide of (3); (1) can be used to form a comprising the polynucleotide of (3). (1) can be used to form a cardiac function in mammals. sequence encodes human adenylylcyclase isoform VI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence encodes the human type V adenylyl cyclase (hAC5) of the invention. hAC5 has a similar putative structure to other adenylyl cyclase isoforms but, like type VI, is distinguishable in that it has a larger N-terminus and a relatively shorter C-terminus as it lacks the C2b region. The hAC5 polypeptides are useful in assays that screen for potential therapeutic agents, which modulate hAC5 activity. These polypeptides are also useful in assays for the diagnosis of diseases and disorders. Agonists of hAC5 are useful control agents in such assays, and they may have useful effects in vivo for treating disease. Antibodies acting as (ant)agonists have diagnostic and therapeutic effects, and are useful in immunoassays for hAC5. (Antiagonists are particularly useful in treating diseases caused by abnormal hAC5 activity (e.g. In the heart and brain), and in diseases which are alleviated by modulating hAC5 activity. The oligonucleotides are useful in methods that inhibit or regulate hAC5 expression in vivo and in vitro. The cloning of the human isotype of AC5 enables the development of tissue-specific and selective pharmacological agents for use in treating particular human diseases associated with hAC5.

Left ventricular tissue of canine heart was used as a source of mRNA. A cDNA library was prepd. in lambda gt10 phage. A 970 bp Aat-HincII fragment from type I adenylyl cyclase cDNA was used as probe. The clones isolated were used to obtain cDNA encoding CACV. This probe may also be used to screen a human cardiac cDNA library to obtain the cDNA encoding human CACV. CACV, its analogues and antibodies are useful in therapy or diagnostic assays, e.g. in modifying and determining cardiac function. A decrease in CACV content of the heart contributes to impaired cAMP prodn. and in heart failure. The CACV can also be used to screen for cpds. which stimulate or inhibit
                                                                                                                                                                                                                                   type

A recombinant Adenylyl cyclase is described which lacks membrane bound domains. Separation and purification of the recombinant enzyme is much easier compared with wild type enzymes and the recombinant enzyme is more stable than the wild type enzymes and the allows easier screening of compounds that stimulate and inhibit Adenylyl cyclase activity. The recombinant adenylyl cyclase activity. The recombinant adenylyl cyclase comprises a chimera of adenylyl cyclase condition and a chimera of adenylyl cyclase condition and a chimera of adenylyl cyclase continued for screening inhibitors and stimulators of adenylyl cyclase activity. Inhibitors of the enzyme are useful for treating cholera, pituitary tumors, heart failure, ischaemia, endocrine disorders and cell necrosis. Stimulators of adenylyl cyclase are useful for treating pseudohypoparathyroidism and other
                                                                                                                                                    Novel soluble mammalian polypeptide composition comprising adenylyl cyclase activity for screening stimulators and inhibitors of adenylyl cyclase, is activated by Gsalpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 3924 BP; 860 A; 1103 C; 1110 G; 851 T; 0 other;

Novel human adenylyl and guanylyl cyclases and polynucleotides encodi the cyclases, useful for treating, diagnosing or preventing cardiovascular, neurological, vision, reproduction and smooth muscle disorders

5; Page 112-113; 116pp; English Claim

The invention relates to human adenylyl and guanylyl cyclases (ADGUC) preferably ADGUC1-ADGUC5 and nucleic acid molecules encoding such preferably ADGUC1-ADGUC5 and nucleic acid molecules encoding such polypeptides. ADGUC sequences are useful in the diagnosis, prevention and treatment of cardiovascular disorders (e.g. angina pectoris, myocardial infarction, ischaemic heart disease, hypertension and atherosclerosis), vision disorders (e.g. extratoconjuctivitis sicca, keratitis, iritis, cataract), neurological disorders (e.g. epilepsy, Alzhelmer's disease, pick's disease, Huntington's disease, dementia, parkinson's disease, pick's disease, Huntington's disease, dementia, mental disorders including mood and anxiety and prion diseases including kuru), reproductive disorders (e.g. infertility, endometriosis, importence, uterine fibroid and gynaecomastia), smooth muscie disorders (e.g. arrhythmias, asthma and migraine) and bacterial infections.

ADGUC polynucleotides are useful for creating knock-in humanised animals or transgenic animals to model human diseases. They are useful in sommatic or generaline gene therapy. ADGUC polynucleotides are also useful cor detecting differences in the chromosomal location due to the individuals abcur or difference in the part and part or affected individuals abcur or difference in the part propertion of the part of the pa individuals. ADGUC polypeptides are useful in a number of drug screening techniques and in vaccines. The present sequence is human ADGUC-2 cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A recombinant Adenylyl cyclase is described which lacks membrane bound domains. Separation and purification of the recombinant enzyme is much easier compared with wild type enzymes and the recombinant enzyme is more stable than the wild type enzyme which allows easier screening of compounds that stimulate and inhibit Adenylyl cyclase activity. The recombinant adenylyl cyclase comprises a chimner of adenylyl cyclase (2 domains linked covalently. The domains may be linked by a linker peptide. The recombinant adenylyl cyclase is useful for screening inhibitors and stimulators of adenylyl cyclase activity. Inhibitors of the enzyme are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel soluble mammalian polypeptide composition comprising adenylyl cyclase activity for screening stimulators and inhibitors of adenylyl cyclase, is activated by Gsalpha

                                 Sequence 5, Application US/08726214

Patent No. 6107076

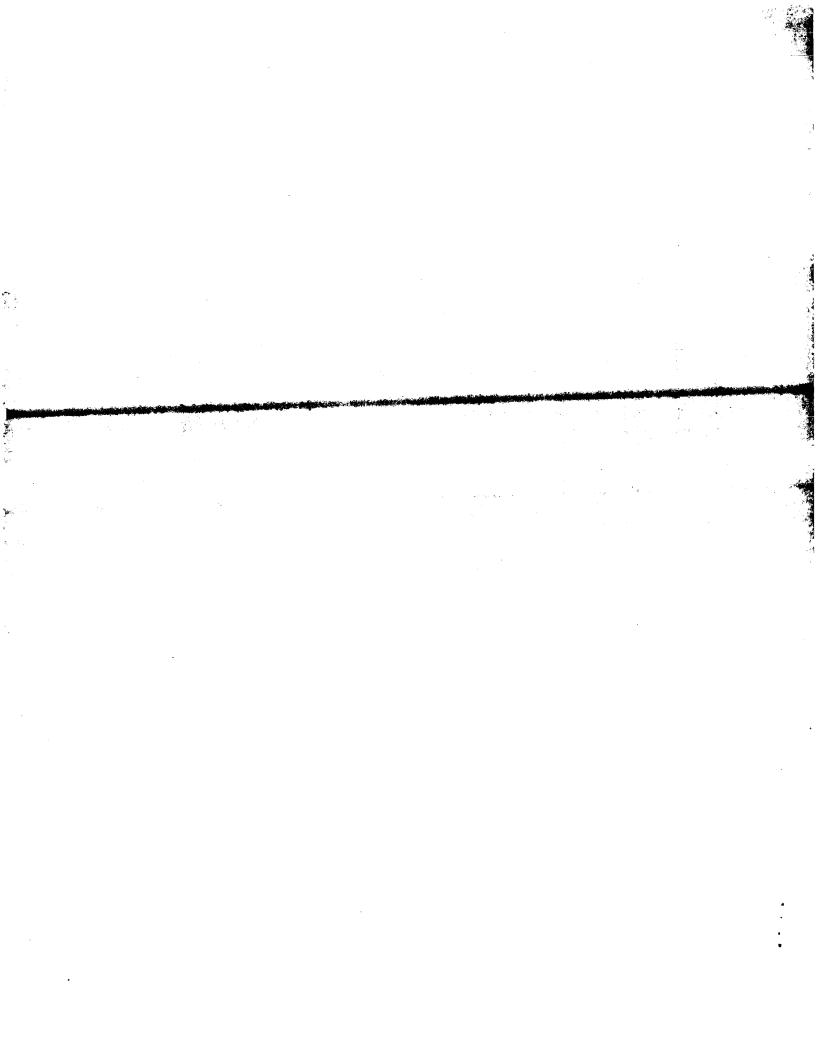

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Tang, Wei-Jen
APPLICANT: Gilman, Alfred G.
TITLE OF INVENTION: SOLUBLE MAMMALIAN ADENILYL CYCLASE
TITLE OF INVENTION: AND USES THEREFOR
NUMBER OF SEQUENCES: 31
CORRESPONDENCE ADDRESS:
STREET: P.O. Box 4433
COUNTY: Houston
STREET: P.O. Box 4433
CITY: Houston
STATE: Texas
